Continued on next page (footnotes at end of table)

**Adopted Levels, Gammas (continued)** $^{187}\text{Pb}$  Levels (continued)

<sup>†</sup> From G-ray energies.

<sup>‡</sup> Values given without comment are from ( $^{36}\text{Ar}, 4n\gamma$ ), based on analogy with heavier odd-A Pb isotopes in which a sequence of three stretched Q transitions connect the yrast  $25/2^+$  state to a low-energy  $13/2^+$  isomer.

# Limit deduced from observation of  $\alpha\gamma$  prompt coincidence in  $^{191}\text{Po}$   $\alpha$  decay.

@ Band(A):  $\pi=+$  yrast states ([1998Ba88](#)). Possible configuration is ( $\nu i_{13/2}$ ) – weakly coupled to near-spherical  $^{186}\text{Pb}$  core states.

 $\gamma(^{187}\text{Pb})$
